

## EFT studies of neutrinoless double beta decay with LR symmetric model

*Wednesday 8 May 2024 14:00 (30 minutes)*

Starting from LR symmetric model, one identifies corresponding SMEFT operators and subsequently LEFT operators, these operators are then used to construct the neutrino mediated long-range neutrinoless double beta decay process. With the S-matrix theory, we derive the decay width and recover the expressions obtained from a direct model calculation. These results are compared with the widely used Master Formula and reasonable agreements are achieved.
