

Heavy Neutrino Search with the ATLAS experiment

Friday 10 May 2024 14:40 (20 minutes)

A widely adopted approach to explain the observed small neutrino masses is the so-called SeeSaw mechanism. Many such extensions of the Standard Model predict heavy neutrinos, which can be produced in proton-proton collisions at the Large Hadron Collider. In this talk, recent searches for heavy neutrinos with the ATLAS experiment will be presented.

Collaboration (if any)

ATLAS
