## The neutral scalars to Dark matter under the LHC

Thursday 9 May 2024 15:40 (20 minutes)

The 2HDM+S is the singlet extension of 2HDM, which can accommodate more physics potential beyond the SM. We summarize the type II 2HDM+S model with various Higgs potential structures, and discuss several scenarios with different mass hierarchy. In this study, we concentrate on the mass eigenstate of the 2HDM+S, and test the parameter space of Higgs mixing angles and masses against the experimental constraints, including 125 GeV Higgs measurements, BSM Higgs direct searches, STU and B-physics observables. In particular, we study the exotic channels of  $h_{125} \rightarrow A_S A_S$  and  $h_{125} \rightarrow h_S h_S$  decays for the light singlet-like Higgs scenarios  $m_{h_S/A_S} < 62.5$  GeV, and determine the limit of Higgs mixing angles. Furthermore, we study the phenomenological distinction between 2HDM+S and 2HDM, and explore the indirect impact of the singlet admixture on the parameter space of  $\cos(\beta-\alpha_1)$ ,  $\tan\beta$  and  $m_A$ .
